

1 Deep ensemble of differentiable surrogates

independently retrained
(M random seeds)

design Jacobian
 $\partial \mathbf{r} / \partial \mathbf{g}_k$ (free autodiff)

per-component spread
across seeds

2 Solver-free sign-agreement gate

sign-agreement score $a_k \in [0, 1]$

impedance gradient

seed-stable

TRUSTED: free autodiff

radiation gradient

seed-unstable

FLAGGED: 1 full-wave solve

$\tau = 0.9$

3 Cost-optimal hybrid gradient

hybrid
gradient

$\nabla_g \mathcal{L}$

- free autodiff on trusted
- finite-difference on flagged only

AUC **0.91** predicting gradient sign-correctness
on an external transfer-matrix benchmark

trusts impedance, rejects radiation
the seed-unstable direction that fools MC-dropout

A solver-free deep-ensemble gradient-reliability gate: trust free autodiff where seeds agree, verify only where they do not.
